

REMDEVICE LAUNCHES NEW PRODUCT RANGE

Italian company REMdevice has launched a new range of products in the field of wireless industrial radio control systems. Operating from its headquarters in Nove and production plant in Bassano, the company designs and manufactures all its products in-house. Established in 2003, REMdevice has become recognised for the development of sustainable, functional and safe technology.

Responding to the needs of users, the company has designed radio command units protected from external agents such as dust, water and dirt, thus protecting the integrity of all electronic components, ensuring operation in the harshest environmental and industrial conditions. The notable technical feature, which distinguishes REMdevice, is the patented technology of the induction recharge, which allows

no external battery, thus ensuring the durability, safety and robustness of all remote controls it manufactures.

The new range is essentially divided into three large families: the T Series, a robust and simple radio control with a maximum of eight buttons, for simple applications that do not require special uses. The innovation on the T Series is that even this simple remote control is designed to have no external battery. It is equipped with in-house fixed non-rechargeable lithium batteries that guarantee a life of up to 1200 hours of work. Another innovation in the T-Series radio controls is the Remsys Code technology, which allows the replacement of the remote control in case of loss or accidental breakage, without replacing any eeprom from the receiver installed in the machine. All this through of a simple code that activates by pressing a series of

buttons.

The Brick and Pail are more complex radio controls where the technology of induction charge dominates. The Brick is a button radio control that reaches up to 12 buttons that is customisable and usable in situations of complexity. Compact and resistant, this easily programmable transmitter offers an operating life of up to 40 hours without any recharging. It is the first keyboard with a patented induction recharging system, fully isolated from dust and humidity. The Pail is a joystick radio control equipped with selectors and knobs that allow you to work with a small device

which allows the operator to control and manoeuvre equipment and machinery that require a greater complexity of functions and movements.

The product's range is completed with the Genesis remote control - a joystick radio control larger than the Pail, which provides usability and comfort because of its ergonomic design and low weight. Fully isolated from dust and humidity, it has been designed to widen configuring

possibilities to their maximum, according to the most demanding applications. Simple and effective in any working environment, without being cumbersome, it can house various types of actuators and joysticks, selectors and potentiometers, buttons, data feedback and 2.6in and 3.2in displays. It is a universal platform that finds application from logistics to lifting, from marine and rail transport and

excavation to every type of crawler, in aerial platforms and forestry and mining applications.

Through its new innovations, REMdevice aims to establish a new quality standard in its target markets.
